

WHAT IS CLAIMED IS:

1. A hose connection assembly for a vacuum cleaner, which is disposed between a dust-collecting chamber of a cleaner body and a connection part of a suction brush, the hose connection assembly comprising:

- 5 a flexible hose having one end connected to the dust-collecting chamber;
 a hose holder connected to the other end of the flexible hose and being removably connected to the connection part of the suction brush; and
 a handle mounted on the hose holder to assist in connecting and disconnecting the hose holder with respect to the connection part.

10

2. The hose connection assembly for the vacuum cleaner of claim 1, wherein a mounting portion having a bead is formed on an outer circumference of the hose holder to mount the handle thereon, and the handle is rotatably mounted on the mounting portion.

15

3. The hose connection assembly for the vacuum cleaner of claim 2, wherein the handle comprises a fixing portion shaped as a cylinder and is mounted on the mounting portion, and a holding portion protruding from one side of the fixing portion in a perpendicular direction, and the fixing portion has a larger diameter than that of the mounting portion, thereby being rotatable about the mounting portion through 360° .

20

4. The hose connection assembly for the vacuum cleaner of claim 3, wherein the bead has a diameter difference relative to the cylindrical surface of the mounting portion that is larger than a gap formed by the diameter difference between the mounting portion and the fixing portion.

5. The hose connection assembly for the vacuum cleaner of claim 4, wherein one circumferential bead is formed along an outer circumference of the mounting portion in an annular pattern.

5 6. The hose connection assembly for the vacuum cleaner of claim 4, wherein a plurality of circumferential beads are formed along an outer circumference of the mounting portion at predetermined intervals from each other.

7. The hose connection assembly for the vacuum cleaner of claim 3, wherein
10 the holding portion is provided with a protrusion to prevent slipping when a user holds the holding portion.

8. An upright type vacuum cleaner comprising:

 a cleaner body having a dust-collecting chamber and a driving chamber, each
15 being divided by a partition;

 a suction brush disposed below the cleaner body and having a connection part to form a flow channel to the dust-collecting chamber; and

 a hose connection assembly interposed between the dust-collecting chamber and the connection part, the hose connection assembly comprising,

20 a flexible hose having one end connected to the dust-collecting chamber,

 a hose holder connected to the other end of the flexible hose and removably connected to the connection part, and

 a handle mounted on the hose holder to assist in connecting and disconnecting the hose holder with respect to the connecting portion.

9. The upright type vacuum cleaner of claim 8, wherein a mounting portion having a circumferential bead is formed on an outer circumference of the hose holder to mount the handle therein, and the handle is rotatably mounted on the mounting portion.

5 10. The upright type vacuum cleaner of claim 9, wherein the handle comprises a fixing portion shaped as a cylinder and is mounted on the mounting portion, and a holding portion protruding from one side of the fixing portion in a perpendicular direction, and the fixing portion has a larger diameter than that of the mounting portion, thereby being rotatable about the mounting portion by 360° .

10 11. The upright type vacuum cleaner of claim 10, wherein the circumferential bead has a diameter difference relative to the cylindrical surface of the mounting portion that is larger than a gap formed by the diameter difference between the mounting portion and the fixing portion.

15 12. The upright type vacuum cleaner of 11, wherein one circumferential bead is formed along an outer circumference of the mounting portion in an annular pattern.

20 13. The upright type vacuum cleaner of claim 10, wherein a plurality of circumferential beads are formed along an outer circumference of the mounting portion at predetermined intervals from each other.

 14. The upright type vacuum cleaner of claim 10, wherein the holding portion is provided with a protrusion to prevent slipping when a user holds the holding portion.

15. The hose connection assembly for the vacuum cleaner of claim 2, wherein the mounting portion has a circumferential bead formed on an outer circumference of the mounting portion to mount the handle thereon.

5 16. The hose connection assembly for the vacuum cleaner of claim 2, wherein the mounting portion has a plurality of circumferential bead sections formed on the outer circumference of the mounting portion to mount the handle thereon.
